

Biomolecular Structure

Class Quiz-3

Total marks – 20

(Date-20/02/2026)

- (1) Chaperone proteins, or molecular chaperones, are proteins that assist others to fold properly during or after synthesis. Give an example and briefly explain how they assist in protein folding. [5]
- (2) Write a short note using schematic diagram(s) (if any) on the role of proteins and their interactions in Alzheimer's disease [5]
- (3) Draw the Double-stranded structure of DNA whose sequence is 5'-GC-3' [5]
- (4) Give four different functions of RNA that are otherwise ascribed to proteins
